Evaluate documentation

Evaluate on the Hub

and get access to the augmented documentation experience to get started

You can evaluate AI models on the Hub in multiple the different options:

Community Leaderboards bring together the best models them accessible to everyone by ranking them.

Model Cards provide a comprehensive overview of a perspective.

Libraries and Packages give you the tools to evaluate

Community Leaderboards

Community leaderboards show how a model performs there are leaderboards for question answering, reasoning. If you're tackling a new task, you can use a leaderboard

Here are some examples of community leaderboards:

There are many more leaderboards on the Hub. Check or use this dedicated Space to find a leaderboard

Model Cards

Model cards provide an overview of a model's capabilities model's author. They are a great way to understand

Unlike leaderboards, model card evaluation scores are calculated by the community.

For information on reporting results, see details on [reporting metadata](#).

Libraries and packages

There are a number of open-source libraries and pre-trained models on the Hub. These are useful if you want to create a custom evaluation task.

LightEval

LightEval is a library for evaluating LLMs. It is highly customizable. Visit the [LightEval repository](#) for more details.

For more recent evaluation approaches that are possibly currently more actively maintained, check out [LightEval](#).

Evaluate

A library for easily evaluating machine learning models.

With a single line of code, you get access to dozens of domains (NLP, Computer Vision, Reinforcement Learning, etc.) and machine or in a distributed training setup, you can evaluate in a reproducible way!

Visit the [Evaluate organization](#) for a full list of integrations, a dedicated Space with an interactive demo for how to use Evaluate, detailing the metrics, limitations and usage.

Learn the basics and become familiar with loading datasets and models. Start here if you are using Evaluate for the first time.

Practical guides to help you achieve a specific goal, such as how to use Evaluate to solve real-world problems.

High-level explanations for building a better understanding of the considerations going into evaluating a model or comparing measurements, and comparisons.
