and get access to the augmented documentation expanded

to get started

PEFT (Parameter-Efficient Fine-Tuning) is a library that allows you to adapt pre-trained models to various downstream applications with a small number of parameters because it is prohibitively costly. PEFT (extra) model parameters - significantly decreasing the number of parameters, yielding performance comparable to a fully fine-tuned model, while reducing the number of parameters to train and store large language models (LLMs) or other models.

PEFT is integrated with the Transformers, Diffusers, and Llama libraries, providing a faster and easier way to load, train, and use large models.

Start here if you're new to PEFT to get an overview of the library and how to train a model with a PEFT method.

Practical guides demonstrating how to apply various PEFT methods to tasks like image classification, causal language modeling, and more. Learn how to use PEFT with the DeepSpeed library.

Get a better theoretical understanding of how LoRA, LLaMA, and other methods reduce the number of trainable parameters to make training more efficient.

Technical descriptions of how PEFT classes and methods work under the hood.
